

# Analysis of electrode materials for zinc-manganese batteries

Are manganese oxides a cathode material for zinc ion batteries?

Manganese oxides as cathode materials for zinc ion batteries and manganese dioxide with varying phase structures inevitably undergo challenging crystallization transitions during electrochemical cycle, involving volumetric changes and structural collapse, all of which require outstanding solutions.

Is electrolytic manganese dioxide a positive electrode active material for aqueous zinc-ion batteries?

Provided by the Springer Nature SharedIt content-sharing initiative This study reports the phase transformation behaviour associated with electrolytic manganese dioxide (EMD) utilized as the positive electrode active material for aqueous zinc-ion batteries.

What types of cathode materials are used for aqueous zinc-ion batteries?

Up to the present, several kinds of cathode materials have been employed for aqueous zinc-ion batteries, including manganese-based, vanadium-based, organic electrode materials, Prussian Blues, and their analogues, etc.

What are zinc ion batteries?

Zinc-ion batteries (ZIBs), which use mild aqueous electrolyte, have attracted increasing attention, due to their unique advantages such as low cost, high safety, environmental friendliness, and ease of manufacture. At present, developing a kind of cathode materials with stable structures and large capacities for ZIBs is a hot research topic.

What is the energy storage mechanism of manganese-based zinc ion battery?

Energy storage mechanism of manganese-based zinc ion battery In a typical manganese-based AZIB, a zinc plate is used as the anode, manganese-based compound as the cathode, and mild acidic or neutral aqueous solutions containing  $\text{Zn}^{2+}$  and  $\text{Mn}^{2+}$  as the electrolyte.

What are aqueous zinc ion batteries (azibs)?

Aqueous zinc ion batteries (AZIBs) present some prominent advantages with environmental friendliness, low cost and convenient operation feature.  $\text{MnO}_2$  electrode is the first to be discovered as promising cathode material. So far, manganese-based oxides have made significant progresses in improving the inherent capacity and energy density.

Aqueous zinc-ion batteries (ZIBs) are a promising battery technology with low costs and high safety. However, dissolution, self-aggregation and irreversibl ... The results indicate that transition metal doped electrode material ... Rechargeable aqueous zinc-manganese dioxide batteries with high energy and power densities. Nat Commun. 2017; 8: ...

# Analysis of electrode materials for zinc-manganese batteries

As a multivalent ion battery, zinc-ion battery (ZIB) has excellent  $\text{Zn}/\text{Zn}^{2+}$  reversibility, small ionic radius (0.74 Å) of  $\text{Zn}^{2+}$ , low equilibrium potential (-0.76 vs. SHE), and high theoretical volumetric and mass specific capacities (5855 mA h cm<sup>-3</sup> and 819 mA g<sup>-1</sup>) [7] is an efficient, safe, economical, and simple energy storage battery with broad application ...

Considering some of these factors, alkaline zinc-manganese oxide ( $\text{Zn-MnO}_2$ ) batteries are a potentially attractive alternative to established grid-storage battery technologies.  $\text{Zn-MnO}_2$  batteries, featuring a Zn anode and  $\text{MnO}_2$  cathode with a strongly basic electrolyte (typically potassium hydroxide, KOH), were first introduced as primary, dry cells in 1952 and ...

Due to its high energy density, non-toxic, economical and efficient, manganese oxide stands out as a promising cathode material for employment in aqueous zinc-ion batteries. However, the Jahn-Teller effect of  $\text{Mn}^{3+}$  and manganese dissolution impose limitations on the widespread application of aqueous zinc-ion batteries during charging and discharging.

Aqueous  $\text{Zn}/\text{MnO}_2$  batteries, leveraging the  $\text{Mn}^{2+}/\text{MnO}_2$  conversion reaction, are gaining significant interest for their high redox potential and cost-effectiveness. However, they typically require a highly acidic environment to initiate this redox process. Herein, Glycine (Gly), a gentle and safe amino acid, is employed to enhance the effectiveness of ...

There is growing demand for powering portable electronic devices to electric vehicles in recent years. The inconsistent output of renewable energy sources and the rise of electric vehicles further its demand to improve and innovate on energy storage materials [3, 12]. Rechargeable batteries, including lithium-ion (Li-ion) and sodium-ion (Na-ion) batteries and ...

This work developed the feasibility of quasi-eutectic electrolytes (QEEs) in zinc-manganese batteries, in which the optimization of ion solvation structure and Stern layer ...

In 1988, Shoji et al. [10] used zinc sulfate solution as the electrolyte of a zinc-manganese dioxide battery, paving the way for further research into AZIBs. According to recent research, AZIBs can be divided into static AZIBs (mainly including alkaline electrolyte and mild electrolyte) and zinc-based redox flow batteries (such as Zn-Fe [11], Zn-Br<sub>2</sub> [12], and Zn-I ...

In the realm of AZIBs, the cathode materials significantly influence the overall performance of the battery system. At present, manganese oxides, vanadium oxides, and Prussian blue analogues have established themselves as suitable cathode materials for AZIBs [4]. Among these, manganese oxides are considered to be the most promising cathode ...

Manganese oxides as cathode materials for zinc ion batteries and manganese dioxide with varying phase structures inevitably undergo challenging crystallization transitions ...

Aqueous zinc ion batteries (AZIBs) present some prominent advantages with environmental friendliness, low cost and convenient operation feature. MnO<sub>2</sub> electrode is the ...
