

What is a lithium battery?

**Lithium batteries:** Lithium batteries typically refer to non-rechargeable, primary batteries. These batteries use lithium metal as one of their primary components. The lithium metal reacts with other materials within the battery to produce electrical energy. Lithium batteries can typically be found in wrist watches, TV remotes and children's toys.

How much energy does a lithium ion battery have?

According to the U.S. Department of Energy, lithium-ion batteries can reach an energy density of about 150 to 200 watt-hours per kilogram, significantly higher than that of nickel-cadmium (NiCd) or lead-acid batteries.

**Long Lifespan:** The longevity of lithium-ion batteries enhances their overall value.

What are the different types of lithium ion batteries?

Lithium-ion battery types differ based on the lithium compound used in the anode electrode. There are six different types of lithium batteries: LFP batteries have Lithium Ferrous Phosphate ( $\text{LiFePO}_4$ ) as the anode material, and this is one of the most widely adopted battery technologies nowadays.

Do electronics use lithium batteries?

Yes, electronics use lithium batteries, but they do not all use the same type because each device has a battery that is compatible with it. We will be looking into six different types of lithium batteries. The many types of lithium batteries depend on chemical reactions and specific unique materials to store energy.

What is a lithium ion battery used for?

More specifically, Li-ion batteries enabled portable consumer electronics, laptop computers, cellular phones, and electric cars. Li-ion batteries also see significant use for grid-scale energy storage as well as military and aerospace applications. Lithium-ion cells can be manufactured to optimize energy or power density.

Are lithium ion batteries safe?

The safety concerns of lithium metal battery are what caused the lithium-ion battery to be developed. While the lithium metal batteries have a higher energy density, the Li-ion battery is very safe when it is charged and discharged using specific safety guidelines. Today, the top five leading lithium-ion battery producers are;
