

What is a battery protection circuit / IC?

Battery protection circuits / IC solutions and reference designs that allow easy design-in and ensure safe charging and discharging - prevent damage and failures.

Why do you need a battery protection IC?

That is why we design our battery protection ICs to detect a variety of fault conditions including overvoltage, undervoltage, discharge overcurrent and short circuit in single-cell and multi-cell batteries, so you can enhance the safety of your battery pack.

What is a protection circuit module for lithium batteries?

A typical Protection Circuit Module for lithium batteries includes integrated circuits (ICs) that manage voltage and current, temperature sensors such as PTC and NTC thermistors, and various electronic components that facilitate real-time monitoring and protection functions.

What battery management IC devices does analog devices offer?

Analog Devices offers a broad portfolio of high performance battery management IC devices including battery chargers, companion battery charge controllers, and battery backup managers. Battery chargers are for both wireless and wired applications and may be used for any rechargeable battery chemistry.

How does a PCM protect a battery?

Over-discharge protection is critical because it prevents the battery voltage from dropping below a safe threshold, which can lead to a significant loss of capacity and damage the battery's internal structure. A PCM manages this by cutting off the circuit when the voltage drops too low, thus preserving the battery's operational life and efficiency.

What is a secondary protection circuit?

Secondary protection circuits provide an additional layer of safety, activating if the primary circuits fail. This redundancy ensures the battery remains protected even under fault conditions, thereby increasing the overall safety and reliability of the battery system.

A fully integrated cost-effective and low-power single chip Lithium-Ion (Li-Ion) battery protection IC (BPIC) for portable devices is presented. The control unit of the battery protection system and the MOSFET switches are integrated in a single package to protect the battery from over-charge, over-discharge, and over-current. The proposed BPIC enters into ...
