Is silicon a good negative electrode material for lithium ion batteries?

Silicon (Si) is a promising negative electrode material for lithium-ion batteries (LIBs), but the poor cycling stability hinders their practical application. Developing favorable Si nanomaterials i...

What materials are used for negative electrodes?

Carbon materials, including graphite, hard carbon, soft carbon, graphene, and carbon nanotubes, are widely used as high-performance negative electrodes for sodium-ion and potassium-ion batteries (SIBs and PIBs).

Can Si nanomaterials be used as negative electrode materials for LIBS?

Besides, when serving as negative electrode materials for LIBs, Si nanotubes exhibit better Li storage performance than Si nanoparticles and Si nanowires, showing a capacity of 3044 mAh g⁻¹ at 0.20 A g⁻¹ and 1033 mAh g⁻¹ after 1000 cycles at 1 A g⁻¹. This work provides a controllable approach for the synthesis of Si nanomaterials for LIBs.

How can nanomaterials improve the electrochemical performance of electrode materials?

Different nanostructures make different contributions toward improving the electrochemical performance of electrode materials, so the synthesis of nanomaterials is promising for controlling the morphology and size of electrode materials.

Can nibs be used as negative electrodes?

In the case of both LIBs and NIBs, there is still room for enhancing the energy density and rate performance of these batteries. So, the research of new materials is crucial. In order to achieve this in LIBs, high theoretical specific capacity materials, such as Si or P can be suitable candidates for negative electrodes.

Can a carbon nanofiber membrane be used as a negative electrode material?

Su et al. 215 developed a continuous and flexible porous carbon nanofiber membrane as a negative electrode material for SIBs by electrospinning a mixture of polyacrylonitrile and ultrafine zeolite-imidazolate skeleton (ZIF-8) nanoparticles and then carbonizing it at 1200 °C (Figure 14B).
