

Can pulse charging reduce the charging time at 8 °C?

The experimental results show that the pulse charging method with 12C pulse discharge rate and 25% capacity protection ratio can reduce the charging time by 11% at -8.5 °C compared to the traditional constant current (1C) and constant voltage charging method.

Can a pulsed current charge improve battery life?

A pulsed current charging technique was previously proposed to improve the cycle life of lead-acid batteries [25,26,27,28]. Then, it was extended to the Li-ion battery technique [6,29,30]. The current pulse and voltage pulse are the two types of pulse modes.

How does pulsed current affect battery charging speed?

The magnitude of pulsed current had the largest impact on the overall characteristics of batteries. A high magnitude current could shorten the charging time, while the charging capacity had a decrease and the battery temperature rose quickly. For the NPC strategy, the negative pulse time mainly impacted the charging speed.

Does pulse charging prolong the life of lithium-ion batteries?

Hence pulse charging can prolong the life of lithium-ion batteries [31,32]. The battery can be preheated using pulse charging only when the capacity of the battery is more than 50% since the pulsed heating method involves pulse discharging, which consumes the capacity of the battery.

What is pulse charging?

Pulse charging, one of several charging methods for reducing charging time while maintaining cycle life, consists of repeated high current pulses separated by low current or short relaxation periods, as shown in Figure 2.

What is pulse charging of a lithium-ion battery?

Pulse charging refers to the use of periodically changing current to charge the battery. The pulse current can be positive (i.e. charging) or negative (i.e. discharging). Because the period of pulse charging can be very short, relatively high currents can be used. Pulse charging of a lithium-ion battery has several advantages.

This article presents the possibility of battery regeneration with pulse charging. With pulsing charging is possible to recover the faded capacity of batteries. The result of regeneration is based on how much the structure of the battery is damaged. There are several ways to secure pulse charging like programmable power supply or circuits for shaping and ...

3.3 Battery pulse heating test. The Arbin BT2000 of the bidirectional charging system supplied different pulse current excitations for heating LiBs, and the PC controlled the pulse heating procedures of the program. ... This paper provides a guideline for further study that focuses on shortening the heating time before charging

for LiBs at low ...

How Long Does It Take to Charge a Dead Car Battery? Generally, it takes about 2 to 4 hours to fully charge a normal-sized car battery with a 20 Amp battery charger and ...

In the realm of charging current regulation, research indicates that adopting a pulse charging (PC) strategy, as opposed to traditional constant current or multi-stage constant current charging methods, can significantly enhance the battery life management effect [37], [38] intermittently adjusting the battery voltage and anode potential using specific pulse ...

Multistage constant current (MCC), pulse charging, boost charging, and variable current profiles (VCP) are among the fast charging methods used to reduce charging ...

The charging time of Level 3 is only about 15-30 minutes, while the temperature rises higher than that of Level 1 and Level 2. Thus, the safety during the charging ...

In the early 2000s, Notten et al. 35 proposed boost-charging for Li-ion batteries, where charging time is markedly reduced by a CV-CC-CV and 2-step-CCCV charging protocols.

The experimental results show that the pulse charging method with 12C pulse discharge rate and 25% capacity protection ratio can reduce the charging time by 11% at -8.5 ...

a 7.58% reduction of the total charging time compared with the traditional charging method. Keywords: Battery Charger, Power Converters, Battery Charging Approach, Bipolar Pulse, Battery Lifespan. 1 Introduction Electric-driven transportation is to be in extensive use due to its high efficiency and the

With the increase of the negative pulse time, the charging capacity increased by about 3.3%, while the battery charging time increased by 36.9%. The rising temperature ...

Pulse charging may be able to charge at even higher rates without gassing if it can get a burst of current into the cell before it starts to gas. However it is possibly more useful for dealing with the second lead-acid battery problem - sulphation.
