

What are the best practices for bending or forming components?

Here are some best practices for bending or forming various component leads. For parts with long leads, such as axial resistors, diodes, and capacitors, it is fairly easy to use a lead forming tool such as 1568-1132-ND to create 90° bend at specific lengths, pictured below.

What if the lead spacing of a capacitor does not match?

When the lead spacing of a capacitor does not match the hole spacing on your PCB, the capacitor should have its leads formed to avoid exposing the capacitor to excessive mechanical stress. As Figure 1, if the angle of the leads is greater than 30°, lead forming will be required.

How much lead stress should a capacitor have?

The maximum amount of lead stress should be limited to 1.0 Kg in the vertical direction and 0.5Kg in the horizontal direction. You should also avoid bending the leads of your capacitor right next to the capacitor body itself - the internal connections from a capacitor's leads to its actual capacitive material are delicate and can easily be damaged.

Is it possible to bend a circuit board by hand?

Usually doing this by hand is not an issue, but it also rarely looks professional, and it can be difficult to make components lay flat against the board this way. Or you may need to bend shorter leads on something like an IC or a transistor, which comes with its own challenges.

How much space should be left between a capacitor and a lead?

Leave at least a millimeter or two between the capacitor body and the first bend in your leads to avoid breaking those delicate connections.

What is a rounded kink on a resistor?

A rounded curve or v-shaped kink along the lead can prevent it from being inserted past a certain point, and provide a bit of flexibility for resisting vibration and board flexing. This is commonly done with ceramic resistors and capacitors, which are brittle and may be damaged by these forces.

Support the channel on Patreon if you're feeling generous: <https://> up a simple jig for bending capacitor leads using a PCB.

The invention relates to the technical field of capacitor processing and manufacturing equipment, and discloses a separating device for bending and screening capacitor pins, which comprises a base, wherein a soft magnetic strip is arranged on the outer side of a conveying belt, a separating rod is connected to the lower part of a square frame and in a sliding groove, a magnetic ...

The utility model provides an electric capacity stitch drop feed mechanism of bending, it is including installing the fixed branch on bender ejection of compact slide, fixed branch is 7 fonts, its xarm one end is connected with the ejection of compact slide of bender, the perpendicular arm downwardly extending of fixed branch forms the hinge bar, install horizontal telescopic cylinder ...

The utility model discloses a terminal bending and pin cutting mechanism applied to electrolytic capacitors, which comprises a mechanism fixing plate, wherein the middle part of the surface...

Bending the pins apart makes the capacitors stay in place. This will make the soldering process easier now. Keeping them straight will make things more difficult now, because the capacitor may move around, but it ...

The invention discloses a bending pin shearing jig for a capacitor, which comprises the following components: the device comprises a base, an outer cover, a push-pull driving mechanism, a movable cutter die assembly, a fixed cutter die assembly and a limiting feed opening. Through the mode, the bending and pin shearing jig for the capacitor can be used for rapidly and accurately ...

The utility model relates to the technical field of bending and forming of capacitor pins, in particular to a capacitor pin bending machine, which comprises a base, an upper bending...

The utility model discloses an electric capacity pin bending device, it includes the frame, be provided with on the frame bend mechanism and fixed electric capacity and send electric capacity into the feeding mechanism in the mechanism of bending, the mechanism of bending includes a fixed part and a portion of bending, wherein: the fixed part is provided with a movable upper ...

The utility model relates to the technical field of a patch type aluminum electrolytic capacitor, in particular to a pin bending device for producing the patch type aluminum electrolytic capacitor, which is provided with a base, wherein a driving module is embedded in the base; guide rail grooves are vertically arranged on two sides of the upper end surface of the base; the guide ...

In this video you will come to about the importance of using lead bending tool used for resistor, diode, inductor and other electronic components.
