

Break-even point for commercial and industrial energy storage

Can a distributed battery energy storage system replace peak power plants?

This work assesses the economic feasibility of replacing conventional peak power plants, such as Diesel Generator Sets (DGS), by using distributed battery energy storage systems (BESS), to implement Energy Time Shift during peak hours for commercial consumers, whose energy prices vary as a function of energy time of use (ToU tariffs).

Will commercial energy storage economics be attractive in 2021?

Commercial Energy Storage Economics Will Be Attractive in 19 US State Markets by 2021 Identifying Potential Markets for Behind-the-meter Battery Energy Storage: a Survey of u.s. Demand Charges, Tech. Rep. Deployment of Behind-the Meter Energy Storage for Demand Charge Reduction, Tech. Rep.

What is a break-even point (BEP) for battery technology?

Break-even point (BEP) for four battery technologies: OPzS; NiCd; Li-NCA; and FeCr. A reduction of 31%, 38% and 26% in the costs of OPzS, Li-NCA and FeCr makes the BESS viable. In a 5-year horizon, these technologies would become economically attractive.

How much is a retail energy storage incentive?

A retail energy storage incentive is available until fully subscribed under multiple incentive buckets. These incentives range from \$125/kWh to \$350/kWh. (NYSERDA, 2020). Additional property tax exemption incentives are limited to residential customers.

What percentage of storage power is installed in the industrial sector?

Storage installed in the industrial sector represents only 15% of the total installed storage power capacity in the United States, with less than 1% occurring outside of the state of California (U.S. Energy Information Administration, 2020). 3. Research methodology Two manufacturing facilities located in Utah were chosen for analysis.

What is a break-even point (BEP) calculation?

The CBA was carried out through the break-even point (BEP) calculation for four different battery technologies: lead-acid (OPzS), NiCd, Li-NCA and Flow (FeCr), considering the singularities of each type of battery, the electricity tariff and DGS operation costs.

By contrast, combinations equipped with a single renewable-energy source and energy-storage systems have, because of the limitation of renewable-energy generation, break-even points close to or exceeding Y, NT\$2000/tCO₂e, indicating that these combinations are not economically viable without higher carbon fees. Furthermore, it can be observed in the ...
