

Brief introduction of perovskite solar cells

What are perovskite solar cells?

Researchers worldwide have been interested in perovskite solar cells (PSCs) due to their exceptional photovoltaic (PV) performance. The PSCs are the next generation of the PV market as they can produce power with performance that is on par with the best silicon solar cells while costing less than silicon solar cells.

What materials are used in perovskite solar cell research?

In the field of perovskite solar cell research, the most studied materials are hybrid organic/inorganic metal halides.

Can perovskite semiconductor material improve solar power conversion efficiency?

Since 2009, a considerable focus has been on the usage of perovskite semiconductor material in contemporary solar systems to tackle these issues associated with the solar cell material, several attempts have been made to obtain more excellent power conversion efficiency (PCE) at the least manufacturing cost [1, 2, 3].

What is the first report on perovskite solar cells?

J. Am. Chem. Soc. 131,6050-6051 (2009). To our knowledge, this is the first report on perovskite solar cells. Kim, H.-S. et al. Lead iodide perovskite sensitized all-solid-state submicron thin film mesoscopic solar cell with efficiency exceeding 9%. Sci. Rep. 2,591 (2012).

What is a perovskite active layer?

Understanding the perovskite active layer is crucial, as its exceptional light absorption and charge transport properties are key to solar cell performance. The perovskite photoactive thin film has the chemical composition ABX_3 , in which A is an organic or inorganic cation, B is a metal cation and X is a halide anion (Fig. 1a).

What are metal halide perovskite solar cells?

Metal halide perovskite solar cells are emerging as next-generation photovoltaics, offering an alternative to silicon-based cells. This Primer gives an overview of how to fabricate the photoactive layer, electrodes and charge transport layers in perovskite solar cells, including assembly into devices and scale-up for future commercial viability.

Perovskite solar cells are one of the most active areas of renewable energy research at present. The primary research objectives are to improve their optoelectronic ...

Therefore, we will only give a brief introduction and thus will not cover all the aspects in this field. Perovskite solar cells are generally fabricated according to four most common architectures, which can be grouped into two categories including mesoscopic and planar structures (Fig. 4 b-e). For all these solar cells, the perovskite layer ...

-sensitized solar cells (DSSCs) [5] and organic solar cells [6]. Nevertheless, possibly the most recent and promising PV devices are the denominated perovskite solar cells (PSCs), that in ...

Research into organic-inorganic hybrid perovskite solar cells is progressing rapidly and quite remarkable conversion efficiencies exceeding 20% have already been realized by using hybrid perovskite light absorbers [1,2,3,4].The operation of a hybrid perovskite solar cell was first demonstrated by Kojima et al. using methylammonium lead iodide (MAPbI₃, CH₃ ...

This paper provides a brief introduction to the structure, materials and characteristics of PSCs. In addition, some remarks about the stability of these ...

This Primer gives an overview of how to fabricate the photoactive layer, electrodes and charge transport layers in perovskite solar cells, including assembly into ...

The reverse-bias resilience of perovskite-silicon tandem solar cells under field conditions--where cell operation is influenced by varying solar spectra and the specifications of cells and strings when connected into ...
