What is a capacitor discharge switch?

The switch is used to trigger the discharge of the stored energy. When you're working with a capacitor discharge unit, it's important to understand the circuit diagram. This diagram outlines the electrical flow of the components, allowing you to visualize the entire system.

How does a capacitor discharge?

In this topic, you study Discharging a Capacitor - Derivation, Diagram, Formula & Theory. Consider the circuit shown in Fig. 1. If the switch S is thrown to Position-2 after charging the capacitor C to V volts, the capacitor discharges through the resistor R with the initial current of V/R amperes (as per Ohm's law).

What is a capacitor discharge unit?

This type of device is typically used in high-voltage electrical systems where a sudden surge of current is needed. A capacitor discharge unit, or CDU, can provide this lightning-fast surge of power when it's needed. A capacitor discharge unit works by rapidly storing energy in its capacitors, then quickly releasing that energy once it's triggered.

How do I connect a capacitor discharge unit?

CONNECTING THE UNIT Disconnect the wires of your existing system from the transformer and connect them to the output of the CDU. Connect the input of the CDU to the transformer. The system is now ready for operation. See the completed wiring diagram for the connections to the capacitor discharge unit.

What is the difference between capacitor discharge unit MKII and CDU-2?

The Capacitor Discharge Unit MkII circuit diagram. We have called it CDU-2 to identify it separately from our Capacitor Discharge Unit also available from the author. Both these kits are available and the only difference is CDU-1 uses a 2N 3055 transistor and CDU-2 uses a BD 679 Darlington transistor.

What is a capacitor discharge Unit (CDU)?

Capacitor Discharge Units (CDU's) supply a high current 'burst' to the solenoid. This current burst is over by the time the switch contacts open, thus eliminating back emf across the switch contacts. Should a solenoid be left in circuit, the current flowing through it (after the initial surge) will be less than 50mA.
