

What is cold energy storage?

Cold energy storage is an effective way to relieve the gap between energy supply and demand. It can be seen that air conditioner cold storage technology is a critical technique to realize the utilization of new energy sources and energy savings. Generally, liquid-solid phase change material (PCM) is the main type of energy storage material.

What is cold thermal energy storage (CTEs) based on phase change materials?

Multiple requests from the same IP address are counted as one view. Cold thermal energy storage (CTES) based on phase change materials (PCMs) has shown great promise in numerous energy-related applications. Due to its high energy storage density, CTES is able to balance the existing energy supply and demand imbalance.

Can cold thermal energy storage technologies be used at sub-zero temperatures?

This paper comprehensively reviews the research activities about cold thermal energy storage technologies at sub-zero temperatures (from around  $-270\text{ }^{\circ}\text{C}$  to below  $0\text{ }^{\circ}\text{C}$ ). A wide range of existing and potential storage materials are tabulated with their properties.

What are the applications of cold energy storage (CTEs)?

A number of applications for cold energy storage currently in use have been outlined such as air conditioning and free cooling. Selvnes et al. (2021) provided a comprehensive overview of recent advances and research surveys on CTES using PCMs in refrigeration systems. They focused on the latest developments in the field.

How cold storage technology can reduce building energy consumption?

The applications of cold storage technologies can effectively reduce the building energy consumption in the buildings and improve the performance of whole system in the air condition systems, which contribute to the energy-saving and emission-reduction as well as the environmental protection.

Which phase change materials are used in cold energy storage?

The main content of this paper is a comprehensive introduction to recent studies of cold energy storage technology using the solid-liquid phase change materials including heat exchanger types, phase change materials whose phase change temperatures are in the range of  $7\text{-}14\text{ }^{\circ}\text{C}$  and the heat transfer fluid used in the heat exchangers.
