

# Energy prospects of new energy and energy storage materials

Is energy storage a new technology?

Energy storage is not a new technology. The earliest gravity-based pumped storage system was developed in Switzerland in 1907 and has since been widely applied globally. However, from an industry perspective, energy storage is still in its early stages of development.

What are the challenges in energy storage?

There are also challenges in materials synthesis, battery safety, and other aspects that require more personnel and time to solve related problems. Overall, mechanical energy storage, electrochemical energy storage, and chemical energy storage have an earlier start, but the development situation is not the same.

How do governments promote the development of energy storage?

To promote the development of energy storage, various governments have successively introduced a series of policy measures. Since 2009, the United States has enacted relevant policies to support and promote the research and demonstration application of energy storage.

Why do we need a large-scale development of electrochemical energy storage?

Additionally, with the large-scale development of electrochemical energy storage, all economies should prioritize the development of technologies such as recycling of end-of-life batteries, similar to Europe. Improper handling of almost all types of batteries can pose threats to the environment and public health.

Why should we study energy storage technology?

It enhances our understanding, from a macro perspective, of the development and evolution patterns of different specific energy storage technologies, predicts potential technological breakthroughs and innovations in the future, and provides more comprehensive and detailed basis for stakeholders in their technological innovation strategies.

What are energy storage technologies?

Energy storage technologies, which are based on natural principles and developed via rigorous academic study, are essential for sustainable energy solutions. Mechanical systems such as flywheel, pumped hydro, and compressed air storage rely on inertia and gravitational potential to store and release energy.

The world is undergoing a new round of energy reform, and traditional fossil fuels have sparked people's thinking due to their environmental and non-renewable issues [1,2,3]. Seeking a sustainable energy source has become a focus of attention [4,5,6]. Among them, the new battery technology based on electrochemical performance has become a possible ...
