

Does liquid cooling BTMS improve echelon utilization of retired EV libs?

It was presented and analyzed an energy storage prototype for echelon utilization of two types (LFP and NCM) of retired EV LIBs with liquid cooling BTMS. To test the performance of the BTMS, the temperature variation and temperature difference of the LIBs during charging and discharging processes were experimentally monitored.

Are liquid cooling thermal management systems effective?

Liquid cooling thermal management systems are very effective for high energy density cases and can meet most cooling needs, although they may have problems such as coolant leakage and high energy consumption [28,29]. Chen et al. investigated the effect of coolant flow and contact area for roll bond liquid cold plates.

Can liquid cooling system reduce peak temperature and temperature inconsistency?

The simulation results show that the liquid cooling system can significantly reduce the peak temperature and temperature inconsistency in the ESS; the ambient temperature and coolant flow rate of the liquid cooling system are found to have important influence on the ESS thermal behavior.

Which CFD is used for meshing in ANSYS ICEM ESS?

The ANSYS ICEM CFD is used for meshing in this study. Fig. 7 displays the employed mesh of the LIB modules and liquid cooling system in the ESS. Because full-size LIB ESS is too large to perform grid independence test, a single LFP battery module and the cooling plates attached to it are selected.

What is liquid cooling BTMS?

The liquid-cooling BTMS consists of pumps, air conditioner, pipes, valves and cooling plates mounted on the sides or bottom of the battery modules. The temperature of the battery modules during charging and discharging processes is experimentally tested. A full-scale thermal-fluidic model of the ESS prototype is established.

Which cooling media is used in battery thermal management systems?

The common cooling media in battery thermal management systems (BTMSs) are air, liquid, and phase change material (PCM) [22,23]. Air cooling thermal management systems have advantages such as reliability as well as simplicity, but due to the low thermal conductivity of air, the amount of heat it can consume is limited.

Wang et al. [25] researched these energy reuse technologies and proposed a novel pumped thermal-LAES system with an RTE between 58.7 % and 63.8 % and an energy storage density of 107.6 kWh/m³ when basalt is used as a heat storage material. Liu et al. [26] analyzed, optimized and compared seven cold energy recovery schemes in a standalone ...

The increasing global demand for reliable and sustainable energy sources has fueled an intensive search for innovative energy storage solutions [1]. Among these, liquid air energy storage (LAES) has emerged as a promising option, offering a versatile and environmentally friendly approach to storing energy at scale [2]. LAES operates by using excess off-peak electricity to liquefy air, ...

Zhang et al. [11] optimized the liquid cooling channel structure, resulting in a reduction of 1.17 °C in average temperature and a decrease in pressure drop by 22.14 Pa. Following the filling of the liquid cooling plate with composite PCM, the average temperature decreased by 2.46 °C, maintaining the pressure drop reduction at 22.14 Pa.

The primary objective of this study is to develop a simulation model for a liquid cooling plate (LCP) for insulated-gate bipolar transistor (IGBT) modules, with the aim of reducing the operating temperature of wind power ...

Current BTMS mainly adopts the type of air cooling [11], liquid cooling [12], phase change material (PCM) cooling [13], heat pipe cooling [14], and hybrid cooling [15, 16]. Among these, the type of liquid cooling is widely utilized because of its high specific heat capacity and thermal conductivity [17]. Liquid cooling systems can be categorized into direct ...
