Are self-built and leased energy storage modes a benefit evaluation method?

This paper proposes a benefit evaluation methodfor self-built,leased,and shared energy storage modes in renewable energy power plants. First,energy storage configuration models for each mode are developed,and the actual benefits are calculated from technical,economic,environmental,and social perspectives.

What are energy storage configuration models?

Energy storage configuration models were developed for different modes,including self-built,leased,and shared options. Each mode has its own tailored energy storage configuration strategy,providing theoretical support for energy storage planning in various commercial contexts.

What is the profit mechanism in the shared mode?

The profit mechanism in the shared mode is similar to that in the leased mode, with revenue generated from the service fees paid by the new energy power plants for using the energy storage. Therefore, the leader-follower game model can also be used to describe the energy storage configuration scheme in the shared mode.
