To install the new capacitors you'll have to open up the holes in the motherboard, which most likely still have solder in them. The most common method for this is using a solder sucker. Simply heat up the solder, hold the tip of the sucker near and push the trigger. However, with old, sluggish solder, this often doesn't work as desired.

Should a capacitor be replaced if a video card is dissipated?

The replacement needs to have an equal or greater voltage. The larger capacitance isn't so straightforward. Theoretically it could damage the motherboard when it is dissipated, but I'm sure there are systems in place to keep that from happening. Plus 860 uF to 1000 uF isn't a huge change. I replaced a couple of capacitors on a video card.
