

How safe are nickel-metal hydride batteries

Are nickel metal hydride batteries safe?

Nickel Metal Hydride cells and batteries may be highly charged and capable of high energy discharge. Care should be taken to handle these products properly to avoid shorting or misuse that will result in rapid uncontrolled electrical, chemical or high energy release. Always use the products within their specified operational limits.

What is a nickel metal hydride battery?

A nickel-metal hydride battery (NiMH or Ni-MH) is a type of rechargeable battery. The chemical reaction at the positive electrode is similar to that of the nickel-cadmium cell (NiCd), with both using nickel oxide hydroxide (NiOOH). However, the negative electrodes use a hydrogen-absorbing alloy instead of cadmium.

What are the safety precautions for nickel hydride batteries?

NiMH Material Safety Data Sheet Page 4 of 6 ESP reserves the right to alter or amend the design, model and specification without prior notice. Never seal or encapsulate nickel metal hydride batteries. Do not obstruct safety release vents on batteries.

Can a nickel hydride battery be mixed with other chemistries?

Do not mix with batteries of other chemistries, e.g. nickel cadmium. Do not short circuit - may cause burns or fire. Do not incinerate - may burst or release toxic materials. Nickel Metal Hydride cells and batteries are considered to be 'dry cell' products which are unregulated for the purpose of transportation.

What happens if you burn a nickel metal hydride battery?

Burning nickel metal hydride batteries can produce toxic fumes including oxides of nickel, cobalt, aluminum, manganese, lanthanum, cerium, neodymium, and praseodymium. SECTION VI - HEALTH HAZARD DATA
