And demonstrated that the tested new battery - a Li-Ion battery cell with a new generation NMC "single crystal" cathode and a new highly advanced electric electrolyte - will be able to drive a vehicle for more than 1.6 million kilometres, and last more than two decades in grid energy storage even at an intense temperature of 40 C.

Batteries are an important part of the global energy system today and are poised to play a critical role in secure clean energy transitions. In the transport sector, they ...

A January 2023 snapshot of Germany's energy production, broken down by energy source, illustrates a Dunkelflaute -- a long period without much solar and wind energy (shown here in yellow and green, respectively). In the absence of cost-effective long-duration energy storage technologies, fossil fuels like gas, oil and coal (shown in orange, brown and ...

Electric vehicles (EVs) are powered by batteries that can be charged with electricity. All-electric vehicles are fully powered by plugging in to an electrical source, whereas plug-in hybrid electric vehicles (PHEVs) use an internal ...
