

What is a dual-active-bridge DC-DC converter power management system?

This paper presents a novel dual-active-bridge (DAB) bidirectional DC-DC converter power management system for hybrid electric vehicles (HEVs). The proposed system makes it possible to charge an additional battery with regenerative power flows and distributes power from the electrical source to the load efficiently.

What is bi-directional dual active bridge converter with single-phase shift control?

This study predominantly focuses on the Bi-Directional Dual Active Bridge Converter with Single-Phase Shift Control. It is renowned for attaining a broad voltage range through transformer turn ratio adjustments. Its controllable parameters, such as phase shift ratio and duty cycle, bolster its versatility.

Is there a battery dynamic model for hybrid electric vehicles?

Tremblay, O. A generic battery model for the dynamic simulation of hybrid electric vehicles. in IEEE Vehicle Power and Propulsion Conf., VPPC, pp. 284-289. 9-12 Sept 2007. Tremblay, O. & Dessaint, L. A. Experimental validation of a battery dynamic model for EV applications. World Electr. Veh.

What is steady-state analysis of dual active bridge converter with single-phase shift control?

The steady-state analysis of the Dual Active Bridge Converter with single-phase shift control studies the converter's behavior during different modes of operation. The design of the open-loop DAB is for the given specifications and is justified by the open-loop model.

What is hybridpacktm?

Highlights include: Our HybridPACK™ family enables a smooth transition across all power classes from HEV to EV (from 10 kW to 175 kW). These integrated power modules contain all power semiconductors required to drive electric motors of up to 175 kW, with the added bonus of compact inverter designs and optimum support for water cooling.

Does a DAB converter achieve zero-voltage switching & zero-current switching?

The design, modes of operation, and performance metrics of the DAB converter are examined, emphasizing its ability to achieve zero-voltage switching (ZVS) and zero current switching (ZCS) throughout its operating range. The suggested system seeks to maximize EV power management, guaranteeing high dependability and efficiency.

Achieving an efficient EV battery charger necessitates the implementation of a proficient charging algorithm and a high-power converter capable of adeptly regulating battery ...

In this paper, the design, control and power management of a dual active bridge (DAB) converter for an electric vehicle (EV) battery charging system is presented

This simple unit provides a dual-rail variable output ranging from $\pm 2.5\text{V}$ to $\pm 15\text{Vdc}$ with precise tracking of the positive and negative output voltages, still retaining the current limiting and short-proof capabilities of the "master" circuit. As the purpose of such a dual-rail design is to supply experimental or under-repair circuits, the maximum current output delivered was deliberately ...

charging and discharging of Hybrid Battery Storage System (HBSS), another is switching voltages during starting, running and braking modes. With added electrification in automotive designs, the power demands for start-stop of EV and hybrid electric vehicles have increased significantly [1]. For ignition and braking in EV,
