

An illustration of two cells of a film strip. Video. An illustration of an audio speaker. Audio An illustration of a 3.5" floppy disk. ... Solar System Collection; Ames Research Center; Software. Internet Arcade Console Living Room. ... Kerbal Space Program - Interstellar Quest - Episode 2 by Scott Manley. Publication date 2013-11-08

An illustration of two cells of a film strip. Video. An illustration of an audio speaker. Audio An illustration of a 3.5" floppy disk. ... Kerbal Space Program - Interstellar Quest - Episode 50 - Power Grid Upgrades ... so we're building a series of solar power stations designed to live in close solar orbit, and upgrading our existing assets ...

Ions might work for you, since TWR is basically a non-issue in solar orbit. Shouldn't even matter if you have to take a while to recharge batteries out at Jool. A hybrid system using LFO and fuel cells to recharge batteries gets pretty good ISP, too.

I like to set them to open with an action group. In the VAB at the top of the interface there are three blue tabs. The center one switches you to action group mode. Select action group 1, click on your solar panel, and click "toggle solar panel" (or some such) to add this command to the AG. Then in flight, you can tap 1 to open and close your ...

Drain sequence is Fuel cell part first, then pod, then tanks drain but with no charging into pod. So even while the fuel cells are supposedly working (in which the 4 fuel cells in unison should be generating more charge than the ...

Usage. The Fuel Cell uses a small amount of liquid fuel and oxidizer to generate electric charge. When active, one fuel cell will drain a FL-T100 Fuel Tank in around 7.4 hours, and will empty a Rockomax Jumbo-64 ...

Don't forget you need at a minimum 2 solar panels, the communication, and a mystery goo. Leave it on the surface and it will generate and send back science (as long as you have a good signal). I'm still not a master of this stuff, but I got a steady stream of science that auto-generates.

At least that is what my knowledge of solar cells would lead me to believe. But like K² and VirtualCLD said, an ideal cell is basically a diode capable of passing a constant current, so if you were able to cool your solar cell you would reach a maximum current of I_{sc} by connecting the terminals or a maximum voltage V_{oc} by simply applying light.

So one fuel cell used about 3/4 of a T400 and since there are two fuel cells it takes about one and half T400 to transmit one goo experiment. edit2: Okay, I did another test with same rig, but this time using full power. ...

Teeny tiny introduction: Had to go with a new career as 0.25 was released, but unlike my previous two write-ups this time I won't cover all the early stuff happening around ...

Don't forget you need at a minimum 2 solar panels, the communication, and a mystery goo. Leave it on the surface and it will generate and send back science (as long as you have a good signal).
