Is a liquid cooling system suitable for lithium-ion batteries?

The battery thermal management system is critical for the lifespan and safety of lithium-ion batteries. This study presents the design of a liquid cooling system with asymmetric flow channels. To achieve optimal overall performance, a comprehensive multi-objective optimization framework is proposed to optimize the system parameters.

Are liquid cooling designs effective in battery thermal management?

**Discussion and Conclusions** This investigative project evaluated two liquid cooling designs: one with water flowing in channels parallel to the cells (VFD), and the other with coolant channels placed perpendicular to the cells (HFD). These designs were investigated using CFD to assess their effectiveness in battery thermal management.

What is liquid-cooling management system of a Li-ion battery pack (Ni-Co-Mn)?

In this study, a liquid-cooling management system of a Li-ion battery (LIB) pack (Ni-Co-Mn, NCM) is established by CFD simulation. The effects of liquid-cooling plate connections, coolant inlet temperature, and ambient temperature on thermal performance of battery pack are studied under different layouts of the liquid-cooling plate.

How does thermal management of lithium-ion battery work?

Herein, thermal management of lithium-ion battery has been performed via a liquid cooling theoretical model integrated with thermoelectric model of battery packs and single-phase heat transfer.

What is a multi-objective optimization framework for lithium-ion batteries?

An integrated multi-objective optimization framework is proposed. The optimal solution is sought among the trade-offs between the different optimization objectives. The battery thermal management system is critical for the lifespan and safety of lithium-ion batteries.

Liquid cooling employs coolant as a heat exchange medium to regulate the internal temperature of the power battery system [53]. Water pumps and pipelines typically facilitate coolant circulation within the battery system [54]. Liquid cooling can be categorised into two types: direct cooling and indirect cooling [55]. Direct cooling involves immersing the battery ...

# Lithium battery liquid cooling system design drawings

Cooling plate design is one of the key issues for the heat dissipation of lithium battery packs in electric vehicles by liquid cooling technology. To minimize both the volumetrically average temperature of the battery pack and the energy dissipation of the cooling system, a bi-objective topology optimization model is constructed, and so five cooling plates with different ...
