Lithium battery pack with high current and fast voltage reduction

Can a fast lithium-ion battery be charged using a varying current decay protocol?

Paper proposes a fast lithium-ion battery charge using a varying current decay (VCD) charging protocol. Following the VCD protocol, the battery's performance was compared with the performance of batteries charged using conventional protocols. The results showed reduced capacity fade with the number of cycles charged.

How to optimize lithium-ion battery charging?

When exploring optimization strategies for lithium-ion battery charging, it is crucial to thoroughly consider various factors related to battery application characteristics, including temperature management, charging efficiency, energy consumption control, and charging capacity, which are pivotal aspects.

How does a lithium-ion battery pack work?

However, a battery pack with such a design typically encounter charge imbalance among its cells, which restricts the charging and discharging process. Positively, a lithium-ion pack can be outfitted with a battery management system (BMS) that supervises the batteries' smooth work and optimizes their operation.

What are the different lithium-ion battery non-feedback-based charging strategies?

In general, the available lithium-ion battery non-feedback-based charging strategies can be divided into four model-free methodology classes, including traditional, fast, optimized, and electrochemical-parameter-based (EP-based) charging approaches as shown in Figure 3 [36 - 40].

How can lithium-ion batteries improve battery performance?

The expanding use of lithium-ion batteries in electric vehicles and other industries has accelerated the need for new efficient charging strategies to enhance the speed and reliability of the charging process without decaying battery performance indices.

Does boost charging negatively impact lithium-ion batteries?

The previous discussion on boost charging involves applying a very high current for short periods at the beginning of the charging cycle to charge a completely depleted battery,followed by charging at CC-CV with moderate currents. Boost charging will,therefore,notnegatively impact lithium-ion batteries.
