

Li-ion batteries have an unmatched combination of high energy and power density, making it the technology of choice for portable electronics, power tools, and hybrid/full electric vehicles [1]. If electric vehicles (EVs) replace the majority of gasoline powered transportation, Li-ion batteries will significantly reduce greenhouse gas emissions [2].

4.4.2 Separator types and materials. Lithium-ion batteries employ three different types of separators that include: (1) microporous membranes; (2) composite membranes, and (3) polymer blends. ... high ...

New high-rate electrode materials that can store large quantities of charge in a few minutes, rather than hours, are required to increase power and decrease charging time in lithium-ion batteries.

Lithium-ion batteries (LIBs) are pivotal in a wide range of applications, including consumer electronics, electric vehicles, and stationary energy storage systems. The broader adoption of LIBs hinges on ...

The hollow structure and high mass content (91 wt%) of MoS₂ in the composite guarantee cycle stability and allow for efficient storage (823 mA h g⁻¹ at 1 A g⁻¹ after 200 cycles). The exceptional performance of HFMECs ...

A facile and scalable in situ synthesis strategy is developed to fabricate carbon-encapsulated Fe₃O₄ nanoparticles homogeneously embedded in two-dimensional (2D) porous graphitic carbon nanosheets ...

Efficient utilization of resources is crucial for the sustainable development of the lithium-ion battery industry. Although the traditional R₃̄\$ m space group LiCoO₂ can provide a current advanced discharge capacity of 215-220 mAh g⁻¹; at an upper cut-off voltage of 4.6 V (relative to Li⁰/Li), it still falls far short of its theoretical specific capacity of 273 ...

To simultaneously achieve high compaction density and superior rate performance, a structure-gradient LiNi_{0.8}Co_{0.1}Mn_{0.1}O₂ cathode material composed by a compacted core and an active-plane-exposing shell ...

The lithium-ion battery is a type of rechargeable power source with applications in portable electronics and electric vehicles. ... This surface redox process enables a high rate ...

For example, ~2100 papers on high-rate/power LIBs were published in 2012 one year, while ~4700 new papers were published in 2019 (source:, topic ...

Lithium manganese iron phosphate (LiFeMnPO₄, LMFP) is a novel cathode material for lithium-ion batteries, combining the high safety of lithium iron phosphate with the high voltage characteristics of lithium

manganese phosphate [14,15,16]. This material has garnered attention for its environmental friendliness, higher energy density, and good cycle stability, ...
