

The increasing demand for more efficient and sustainable power systems, driven by the integration of renewable energy, underscores the critical role of energy storage systems (ESS) and electric vehicles (EVs) in optimizing microgrid operations. This paper provides a systematic literature review, conducted in accordance with the PRISMA 2020 Statement, ...

This paper evaluates the design and optimization of an islanded hybrid microgrid for various load dispatch strategies by assessing the optimal sizing of each component, the power system responses ...

The optimal economic power dispatching of a microgrid is an important part of the new power system optimization, which is of great significance to reduce energy consumption and environmental ...

Microgrids have emerged as a key element in the transition towards sustainable and resilient energy systems by integrating renewable sources and enabling decentralized energy management. This systematic review, conducted using the PRISMA methodology, analyzed 74 peer-reviewed articles from a total of 4205 studies published between 2014 and 2024. This ...

Therefore, this study proposes a strategy to optimize the operation of multi-energy microgrids (MEMG) with shared energy storage based on a Stackelberg game. First, the system architecture is introduced, and operation optimization models are established for MEMG operator, user aggregator, and shared energy storage service provider, respectively.

The allocation options of energy storage include private energy storage and three options of community energy storage: random, diverse, and homogeneous allocation. With various load options of appliances, photovoltaic generation and energy storage set-ups, the operational cost of electricity for the households is minimized to provide the optimal operation ...

Connecting multiple heterogeneous MGs to form a Multi-Microgrid (MMG) system is generally considered an effective strategy to enhance the utilization of renewable energy, reduce the operating costs of MGs by sharing surplus renewable energy among them, and generate income by selling energy to the main grid (Gao and Zhang, 2024). Hence, MMGs are proposed to ...

Moazzami et al. studied an economic optimization EM model of an MG integrated with wind farms and an advanced rail energy storage system using the CSA. The novel storage technology using rail energy storage system was a standout of this research work [79]. The inferences from the above-mentioned studies indicated that the CSA performed better ...

The implementation of community power generation technology not only increases the flexibility of electricity use but also improves the power system's load ...

Several strategies allow users to participate in IDSM. A strategy-technology pair of particular interest is to use an energy storage system (ESS) to shift energy use such that the cost-savings of the user is maximized. Assuming that the pricing structure offered by the utility is reflective of their goals, maximizing the savings of the user is equivalent to maximizing the ...

Previous research mainly focuses on the short-term energy management of microgrids with H-BES. Two-stage robust optimization is proposed in [11] for the market operation of H-BES, where the uncertainties from RES are modeled by uncertainty sets. A two-stage distributionally robust optimization-based coordinated scheduling of an integrated energy ...
