New Energy Vehicle Lithium Battery Balancing

Is cell balancing a challenge for lithium-ion batteries?

This study investigates the challenge of cell balancing in battery management systems (BMS) for lithium-ion batteries. Effective cell balancing is crucial for maximizing the usable capacity and lifespan of battery packs, which is essential for the widespread adoption of electric vehicles and the reduction of greenhouse gas emissions.

Why should EV batteries be balanced?

Balanced cells contribute to better SOH across the battery pack, thus improving RUL predictions. ML algorithms that use balanced SOC data can more reliably estimate battery pack RUL, thus supporting longer EV battery lifespans and reliability.

Are battery cell balancing methods essential for EV operation?

This article has conducted a thorough review of battery cell balancing methods which is essential for EV operation to improve the battery lifespan, increasing driving range and manage safety issues. A brief review on classification based on energy handling methods and control variables is also discussed.

Why are lithium-ion batteries used in electric vehicles?

To meet the increased power capacity and voltage requirements for electric vehicle (EV) applications, hundreds of lithium-ion cells are combined in series and parallel to form a battery pack, as individual cell capacity and voltage levels are insufficient to drive the motor load (Feng et al., 2022; Gandoman et al., 2022).

Can passive and active cell balancing improve EV battery range?

Consequently, the authors review the passive and active cell balancing method based on voltage and SoC as a balancing criterion to determine which technique can be used to reduce the inconsistencies among cells in the battery pack to enhance the usable capacity thus driving range of the EVs.

Why is SoC balancing important in EV battery pack?

After performing cell balancing, each cell's SoC reaches 60 % (average SoC) which signifies that all cells have reached to same level or balanced. Therefore, SoC balancing is crucial in EV battery pack to increase the usable capacity. Fig. 3. Charge among five cells connected in series before and after SoC balancing.
