

Can carbon nanotubes be used as anode materials for lithium-ion batteries?

In this work, the facile carbon nanotubes (CNTs) modulation strategy was successfully used to fabricate Bi₅Nb₃O₁₅@CNTs composites as anode materials for lithium-ion battery by a simple solid-state route.

What is the purpose of a battery anode?

The primary goal, from a practical perspective, is to prevent anode failure, which is essential for extending the battery's cycle life. Consequently, innovative and stable structures and materials have been created to enhance anode materials' ability to resist volume changes.

Do lithium-ion batteries have anode materials?

This review article discusses the most recent improvements in lithium-ion batteries' anode materials. Lithium-ion batteries (LIBs) have become the ideal solution for storing electrical energy in portable devices and electric vehicles.

What is a high specific capacity anode?

High specific capacity anode materials, such as silicon (Si) and phosphorus (P), which are typical materials with abundant reserves, low price and high specific capacity, encounter the problem of capacity fading caused by volume expansion during the lithiation process.

Can carbon materials form a conductive network for the Al anode?

Consequently, carbon materials can form a conductive network for the Al anode and buffer its expansion. As shown in Fig. 7 b, Yongguo Huang et al. used ferrocene as the carbon source and expanded graphite as the conductive carrier to prepare an Al@C/expanded graphite three-dimensional structure through ultrasonic and heat treatment methods.

Can silicon be used as an anode in lithium-ion batteries?

At 20 °C, cells delivered 1000+mAh for 60+cycles, retaining 85 % capacity after 120 cycles. Charging at 20 °C and cycling at -40 °C yielded 700+mAh (65 % room temp. capacity) over 40 cycles at 0.1 C. Several challenges hinder the utilization of silicon (Si) as an anode material in lithium-ion batteries (LIBs).

Progress in modification of micron silicon-based anode materials for lithium-ion battery. Author links open overlay panel Xinyuan Chen, Qi ... some studies have proposed a ...

Lithium ion batteries with high energy density are in demand for new energy vehicles, consumer electronics and the rapid expansion of the energy storage market [[1], [2], ...

Lithium-ion batteries (LIBs) have been widely used as portable electronic devices. However, the existing

battery system can no longer meet the increasing demand for ...

As the primary anode material for commercial lithium-ion batteries, graphite forms intercalation compounds during lithiation and exhibits a high lithium-storing capacity. However, ...

Request PDF | On Feb 3, 2020, Zhaolin Li and others published Communication--Self-Template Fabrication of Porous Si/SiO_x/C Anode Material for Lithium-Ion Batteries | Find, read and cite ...

In general, the new materials developed for the anode of LIBs need to have the following characteristics: (1) High energy density. Energy density is a crucial indicator of LIBs" ...

Furthermore, we have investigated the application of the 3D COT network as an anode material for Li-ion batteries. Our findings indicate that the 3D COT network shows ...

In this study, new carboxylates are synthesized for sodium-ion batteries. The bithiophene-based anode material BT demonstrates a high reversible capacity of 201 mA h ...

Bismuth oxide directly grown on nickel foam (p-Bi₂O₃/Ni) was prepared by a facile polymer-assisted solution approach and was used directly as a lithium-ion battery anode for the first time. The Bi₂O₃ particles were covered with thin ...

This review delves into a captivating array of advanced anode materials with the potential to surpass the limitations of traditional graphite. Carbon-based nanomaterials like ...

However, the volume expansion of silicon anode material and instability of solid electrolyte interphase (SEI) layer greatly limits their practical applications. Herein, we ...
