Electrochemical performance of the perovskite-type electrodes is reviewed extensively. In addition, various strategies for enhancing their hydrogen storage capacity as a negative electrode in hydrogen batteries are discussed. Drawbacks and challenges of this technology are also presented.

Are ABO₃ perovskite oxides a good alternative to negative electrode materials?

ABO₃ perovskite oxides are a prominent alternative for negative electrode materials in the next generation of high-temperature and high-performance Ni/oxide batteries due to their excellent discharge capacity at high temperatures.

Can layered perovskite materials be used as electrode materials for Ni-oxide batteries?

Layered perovskite materials have been shown to be useful as electrode materials for Ni-oxide batteries since they can exhibit reversibility and store hydrogen electrochemically, according to the results obtained in the present chapter.

Why are perovskites used as electrodes for lithium-ion batteries?

Owing to their good ionic conductivity, high diffusion coefficients and structural superiority, perovskites are used as electrode for lithium-ion batteries. The study discusses role of structural diversity and composition variation in ion storage mechanism for LIBs, including electrochemistry kinetics and charge behaviors.

What types of batteries use perovskite?

Meanwhile, perovskite is also applied to other types of batteries, including Li-air batteries and dual-ion batteries (DIBs). All-inorganic metal halide CsPbBr₃ microcubes with orthorhombic structure (Fig. 11d) express good performance and stability for Li-air batteries (Fig. 11e).

materials [21-28], have been regarded to be one of the valuable alternatives as negative electrode materials in Ni/ MH batteries. This fact is attributed to the lower cost of perovskite-type oxides than conventional intermetallic alloys, due to its thermally stability, abundance, and Fig. 1 Schematic diagram of the operation of a Ni/MH cell

In this work, we report on the investigation the perovskite-type AgNbO₃ as a model negative electrode for sodium and potassium systems. We demonstrated that during the initial discharge, regardless of the inserted ...

All perovskite asymmetric supercapacitor is constructed among Fe, Co and Mn based perovskite oxides using Fe based as negative potential electrode and Co based as positive one [102]. Their increasing oxidation states trend (Fe 2⁺/3⁺ < Mn 3⁺/4⁺ < Co 3⁺/4⁺) matches with their peak positions and hence help to decide large potential window of asymmetric ...
