

Power transmission and transformation qualifications can be used for energy storage projects

What are the evaluation methods of power transmission and transformation projects?

At present, the traditional comprehensive evaluation methods of power transmission and transformation projects mainly include scoring method, efficiency coefficient method, principal component analysis, analytic hierarchy process method, fuzzy comprehensive evaluation method and so on.

Why do we need power transmission systems?

Power transmission systems are called upon to play a crucial role in the future decarbonized, electrified and digital energy sectors, as they constitute the most effective way of distributing vast amounts of electricity from renewable energy sources to faraway locations.

Why do we need phase-shifting transformers?

This was evident since the early days of interconnected power systems, particularly in huge multi-area systems, such as in Europe and North America, which soon called for the introduction of phase-shifting transformers (PSTs) as a way of partly alleviating this problem.

Are there competing financial interests in power transmission and transformation projects?

It provides a useful reference value for the comprehensive evaluation of power transmission and transformation projects. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

How does the PTTP improve the distribution of power load?

This enhancement contributes to the improved distribution of power load within the PTTP, providing more precise support for the low-carbon intelligent development of intelligent sustainable energy systems. The carbon emissions of the four stages are analyzed, as shown in Figs. 6, 7. Results of total carbon emissions at each stage.
