

Relationship between energy storage installed capacity and discharge

What are the performance parameters of energy storage capacity?

Our findings show that energy storage capacity cost and discharge efficiency are the most important performance parameters. Charge/discharge capacity cost and charge efficiency play secondary roles. Energy capacity costs must be $\leq \text{US\$20 kWh}^{-1}$ to reduce electricity costs by $\geq 10\%$.

Can energy capacity and discharge power capacity be varied independently?

In our exploration of the LDES design space it was assumed that the three scaling dimensions, that is, energy capacity, discharge power capacity and charge power capacity, can be varied independently, even though all three degrees of freedom are not possible for certain technologies.

What is charge/discharge capacity cost & charge efficiency?

Charge/discharge capacity cost and charge efficiency play secondary roles. Energy capacity costs must be $\leq \text{US\$20 kWh}^{-1}$ to reduce electricity costs by $\geq 10\%$. With current electricity demand profiles, energy capacity costs must be $\leq \text{US\$1 kWh}^{-1}$ to fully displace all modelled firm low-carbon generation technologies.

Does power capacity cost affect discharge duration?

Additionally, the duration is largely unaffected by weighted power capacity cost at these levels, but somewhat more affected by RTE. In general, higher energy-to-power ratios and discharge durations occur in both the Northern and Southern Systems when nuclear is the available firm low-carbon technology.

How to determine energy storage capacity in a grid-scale energy storage system?

In (Khalili et al., 2017), Proposed a capacity determination method for grid-scale energy storage systems (ESSs), using the exchange market algorithm (EMA) algorithm, the results show the ability of the EMA in finding the global optimum point of the storage and their hourly charging rate.

What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability (in kilowatts [kW] or megawatts [MW]) of the BESS, or the maximum rate of discharge that the BESS can achieve, starting from a fully charged state. Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity.
