We have designed the I-V test system and solar simulator to work seamlessly together and tested their performance against other solutions.

What is a solar cell testing laboratory?

A complete testing laboratory for characterization of the solar cell lifetime behavior according to the ISOS protocol. Intrinsic and operational stability for solar cell devices are described through reporting the performance of a series of devices subjected to a number of different test conditions.

How do I test a solar cell?

You can effortlessly test the efficiency of your solar cell device using the Ossila Solar Cell Testing Kit-- which combines our solar simulator with our source measure unit and test board. There are several methods used to characterize solar cells. The most common and essential measurement you can take is the current-voltage (I-V) sweep.

How does the automated solar cell I-V test system work?

The automated system is assembled with the solar simulator head mounted directly to our automated solar cell I-V test system. This system provides the quickest and easiest way to characterize your devices thanks to the software-controlled automatic switching of pixels under test in each device.

Are there standardized quality assurance guidelines for solar cells?

Apart from internal individual contract provisions between suppliers and manufacturers, standardized quality assurance guidelines for solar cells do not exist. The lack of standards and individual customer needs means customized test equipment and test are needed. This is where materials testing experts come into play.
