How is temperature measured on a solar panel?

The temperature at three points is measured using the FBG sensor. This three-point measurement is selected based on the pre-measurement experiments conducted on the same panel with more diagonal locations. Researchers can vary the number of sensor locations based on the solar panel type and size.

Why do solar panels need thermal imaging?

Thermal imaging helps to identify mismatched panels where high performing modules are impeded by lower performing modules and overheated connections. An important inspection should be before the expiration of the solar manufacturer's warranty to make sure that any defective panels can be replaced under the warranty terms. Overheating protection.

How do solar panels reduce temperature?

Air and water cooling with phase change material behind the solar PV reduces the panel temperature to 7.5°C compared to conventional PV panels. The temperature of PV modules is mainly monitored using conventional techniques such as thermocouples, Resistance Temperature Detector (RTD) sensors, and thermal imaging cameras.

How does temperature affect solar photovoltaic (PV) performance?

Solar photovoltaic (PV) performance is affected by increased panel temperature. Maintaining an optimal PV panel temperature is essential for sustaining performance and maximizing the productive life of solar PV panels. Current temperature sensors possess a long response time and low resolution and accuracy.

Why do solar panels need a thermography scan?

To assure optimal continuous solar power production, thermography scans should be performed at regular intervals to assess preventive maintenance needs. For example, when modules overheat due to shade, defective cells, or substrings consuming instead of producing power, the module efficiency can drop by 0.5% per Kelvin.

What temperature sensitivity is sufficient for solar applications?

Temperature sensitivity of $6\text{ pm}/^{\circ}\text{C}$ is sufficient for solar applications. Although this proof-of-concept uses only one panel in the outdoor experiment, it can quickly scale up for large-scale applications. With a phase mask, multiple FBGs with a different Bragg wavelength can be parallelly inscribed in the same fibre.
