

What is a solenoid valve?

Solenoid valves have numerous applications thanks to the diverse array of designs available, the materials used in their construction, and their circuit functions. Solenoid valves, being electrically operated, can be automatically and remotely controlled, making them ideal for industrial processes.

Which solenoid valve should I Choose?

For applications where the valve must remain closed for extended periods of time, a normally closed solenoid valve is the best choice as it uses less energy. These valves can also be utilised for safety purposes, such as in gas appliances which require the valve to be closed while not in use.

What factors affect a solenoid valve's flow rate?

Media Compatibility - Whenever a valve is used with water, air, steam, oil, or a specific type of media, the valve's construction material must be compatible. **Operating Pressure** - This affects a solenoid valve's total flow rate the most, for best performance it needs to be balanced with the needs of the system.

What are the circuit functions of a solenoid valve?

The circuit functions of a solenoid valve can include the distribution, dosing, opening and closing and the mixing of the flow of the chosen medium. A solenoid valve's specific purpose is determined by its circuit function. Two-way solenoid valves are one of the most common, used either to permit or prohibit system flow.

What are the different types of solenoid valves?

There are a vast range of applications for solenoid valves with high or low pressures and small or large flow rates and each application will likely use a valve with a specific operating principle. The 3 most common types of solenoid valve are direct acting, indirect acting and semi-direct acting. What types of Solenoid Valves can you find?

How does a pilot operated solenoid valve work?

Control of the solenoid is performed by permanent magnets instead of a spring mechanism, reducing power consumption. Pilot-operated Solenoid Valves use the energy stored in the build-up of pressurised fluid or gas to power the valve's opening or closing and are either internal or external piloted.

Based on the mechanical and electrical models, a model of the solenoid is created in Simpler, in which this model uses initial conditions shown in Table 1 and the simulated 2D model of the solenoid exported from Maxwell software as input parameters to simulate the dynamic response of the solenoid under the effects of design parameters as ...
