

The impact of energy storage charging piles on temperature

Does flow rate affect energy storage during the first charging phase?

By the end of the first charging phase, the rate of energy storage per unit pile length in saturated soil is about 150 W/m higher than that in dry soil. The flowrate seems to have no significant effect on the evolution of the rate of energy storage during the first charging phase, except for cases in saturated soil.

Does temperature affect pile-soil interaction?

Therefore, there is an urgent need for further research to be carried out to investigate thoroughly the temperature effects on pile-soil interaction. The heat exchange capacity of the energy pile depends on the thermal resistivity of the pile and the surrounding soils. The consequently, their thermal behaviour could be different. The pile

What is the maximum temperature of a solar energy pile?

It indicates that both the inlet and outlet temperature of the energy pile undergo a rapid increase during the first hour. Then they increase quite slowly as the underground storage of solar thermal energy continues. The maximum inlet temperature is about 60 °C.

How much energy is stored per unit pile?

Quantitatively, the daily average rate of energy storage per unit pile length reaches about 200 W/m for the case in saturated soil with turbulent flowrate and high-level radiation. This is almost 4 times that in the dry soil. Under low-level radiation, it is about 60 W/m.

How does temperature affect the rate of underground solar energy storage?

Rate of underground solar energy storage Temperature difference between circulating water and surrounding soil drives heat transfer between them. Therefore, the rate of energy storage evolves with the variations of the inlet temperature of the energy pile and the soil temperature.

Can energy piles store solar thermal energy underground?

Ma and Wang proposed using energy piles to store solar thermal energy underground in summer, which can be retrieved later to meet the heat demands in winter, as schematically illustrated in Fig. 1. A mathematical model of the coupled energy pile-solar collector system was developed, and a parametric study was carried out.
