What is a lithium battery?

A lithium battery is an electrochemical accumulator that uses lithium as a chemical element. Any material containing lithium can be the basis of a lithium-ion battery.

How do you choose a battery?

Each type of battery has its own strengths and weaknesses, and it is up to the operators of battery-requiring applications to choose the one that best meets their requirements. Batteries have a predetermined lifespan and number of cycles depending on the climate (ambient temperature) and type of use (depth of discharge).

What materials are used to make a lithium ion battery?

Several different combinations of electrode and electrolyte materials are used, including lead acid, nickel cadmium (Ni-Cd), nickel metal hydride (NiMH), lithium ion (Li-ion) and lithium ion polymer (Li-ion polymer). How to choose a battery? The battery capacity in milliampere-hours (mAh) (calculation method provided below).

How much power do you need to charge a battery?

It is not recommended to let some batteries, especially lead-acid batteries, discharge to less than 50%. To obtain the minimum power you need, divide this result (in amperes/day) by 0.5. Working in 24 V allows you to halve the power required compared to using 12 V, or even divide it by four if you work in 48 V.

How many volts are in a rechargeable battery?

Their voltage, expressed in volts (V): rechargeable batteries are generally 12 V. For larger cells with voltages of 12 V, 24 V or 48 V, separate 2 V cells are used, intended to be assembled in series, and which have a lifespan of about 10 years.

What are the different types of alkaline batteries?

The most common alkaline batteries are zinc manganese dioxide (Zn-MnO<sub>2</sub>) and lithium manganese dioxide (Li-MnO<sub>2</sub>). Alkaline batteries are mainly used for domestic purposes. The main formats are cylindrical (LR3, LR6, LR14, LR20) and button cell.
