The role of heat dissipation fluid in energy storage charging piles

Does hybrid heat dissipation improve the thermal management performance of a charging pile? Ming et al. (2022) illustrates the thermal management performance of the charging pile using the fin and ultra-thin heat pipes, and the hybrid heat dissipation system effectively increases the temperature uniformity of the charging module.

Can a fin and ultra-thin heat pipe reduce the operation temperature of charging piles?

The charging speed of the charging piles was shorted rapidly, which was a challenge for the heat dissipation system of the charging pile. In order to reduce the operation temperature of the charging pile, this paper proposed a fin and ultra-thin heat pipes (UTHPs) hybrid heat dissipation system for the direct-current (DC) charging pile.

Can uthps be used to heat dissipate DC EV charging piles?

The UTHP was especially suitable for the heat dissipation of electronic equipment in narrow space. Thus it could be directly attached to the surface of the electronic components to cool the heat source. However, few researches reported on the application of UTHPs to the heat dissipation of the DC EV charging piles. Fig. 1.

Does heat affect the life of a fast charging pile?

The heat generated during fast charge duration will affect the lifetime of fast charging pile, even a fire accident. The latest data reveals that the present fastest EV charging still performs at a lower rate than internal combustion engine vehicles refueling time (Gnann et al., 2018).

Does a PCM reduce thermal management performance in a high power fast charging pile?

The transient thermal analysis model is firstly given to evaluate the novel thermal management system for the high power fast charging pile. Results show that adding the PCM into the thermal management system limits its thermal management performance larger air convective coefficient and higher ambient temperature.

How much heat does a fast charging pile use?

The heat power of the fast charging piles is recognized as a key factor for the efficient design of the thermal management system. At present, the typical high-power direct current EV charging pile available in the market is about 150 kW with a heat generation power from 60 W to 120 W(Ye et al., 2021).

The utility model discloses a heat dissipation device for a charging pile of a new energy automobile, and relates to the technical field of charging piles, wherein the heat dissipation device comprises a charging pile, a heat dissipation plate and a heat dissipation plate, wherein the charging pile is arranged on a bottom plate, and

The thicker PCM unit hinders the effective heat dissipation path to the adiabatic, and this leads to a smaller temperature decrease of the charging module (Wang et al., 2021). Therefore, the desirable PCM thickness

In the world of electric vehicle charging piles, an efficient and stable cooling system is the key to ensuring its performance and life. Among them, the cooling tower, as an important part of the cooling system, undertakes the task of effectively distributing the heat generated by the charging module to the external environment.

In DC charging piles, the charging module is the main part of generating heat, especially at high power charging. The role of the heat pipe is to rapidly conduct this heat to a place far from the heat source, such as the heat fin, so as to achieve effective heat distribution and keep the charging module running at a suitable
