

What are the secondary battery new energy vehicles

Do electric vehicle batteries have a second life?

In addition, the current state and enhancement opportunities for the second life of electric vehicle batteries are presented. The research highlights the integral role of retired power batteries in applications such as energy storage, communication bases, and streetlights.

Which EV manufacturers are considering secondary use of EV batteries?

Currently, an increasing number of EV manufacturers are considering the secondary use of EVBs. BMW and Nissan are expected to secondary use returned batteries as home energy storage (Ayre, 2016; Dalton, 2016). Chevrolet has set up an energy storage station using old EVBs at the General Motors facility in Michigan (Voelcker, 2016).

Can removed batteries be secondary used before remanufacturing?

However, removed batteries can still be secondary used for other purposes, such as energy storage, before remanufacturing. To promote electric vehicle battery secondary use, this research studies a two-period battery secondary use closed-loop supply chain model consisting of a battery (re)manufacturer, a secondary user and a government.

How to promote electric vehicle battery secondary use?

To promote electric vehicle battery secondary use, this research studies a two-period battery secondary use closed-loop supply chain model consisting of a battery (re)manufacturer, a secondary user and a government. The government may provide subsidies for the secondary users to incentivize electric vehicle battery secondary use.

When should electric vehicle batteries be removed?

Electric vehicle batteries should normally be removed from electric vehicles when their power capacity falls to 70% ~ 80% of new batteries. However, removed batteries can still be secondary used for other purposes, such as energy storage, before remanufacturing.

Can EVB batteries be used for secondary use?

Thereby, the application for the secondary use of EVBs can tremendously enhance batteries' values of their entire life cycle, improving their economic and environmental benefits. After the secondary use of such spent batteries, those with less than 20% of their storage capacity can be disassembled and scrapped (Gu et al., 2018; MIIT, 2018).

1. Introduction. Under the continuous support of the Chinese government's policies and the constant advancement of battery technology, China's electric vehicle (EV) industry has been developing rapidly, with sales of EVs amounting to only 17 600 in 2013 but reaching 1 256 000 by 2018 [1- 3]. With the prolonged use
