

What to do if the lithium battery is broken during the warranty period

When does a lithium battery warranty start?

The product warranty starts from no later than three months after the product arrival or no later than six months after the product shipment. Two parties negotiate to specify the start date based on project conditions. The standard warranty period of lithium batteries is one year.

How long does a lithium battery last?

The standard warranty period of lithium batteries is one year. If extended warranty is required, consult the SSD and evaluate the maximum service life of lithium batteries based on the battery model and application environment. Extended warranty can be provided within the service life and needs to be quoted.

What happens if a lithium battery fails during the warranty period?

Faulty parts replacement: During the warranty period, if an individual failure is caused by the lithium battery quality problem of Party B, Party B is responsible for delivering qualified parts to the receiving place agreed by both parties within the committed service level agreement (SLA).

What is a warranty on a battery?

All of our batteries carry a standard limited one-year warranty from date of delivery against defects in workmanship and/or materials unless stated otherwise. However batteries can fail for reasons not covered by warranty. Some of these are as follows:

What happens if a lithium battery is damaged?

The lithium battery is damaged, broken, or leaks due to improper operations or incorrect connection. Party A does not recharge the batteries in time and the batteries are stored longer than the storage term, which causes capacity loss or irreversible damage to the batteries.

What to do if the lithium battery is broken during the warranty period

The standard warranty period of lithium batteries is one year. If extended warranty is required, consult the SSD and evaluate the maximum service life of lithium batteries based on the ...

Many of those mechanisms do so indirectly by accelerating the SEI layer growth. An example is particle cracking which can happen during fast charging and fast discharging and is exacerbated at relatively lower temperatures. Others, like lithium plating, result in unprotected metallic lithium being exposed to the electrolyte.

This is normally quite obvious to spot when examining the battery. During charging, there may be a pungent smell of rotting eggs. When off charge, the battery will have low levels of acid, and there may be a black coating on the filler caps (It is not possible to check the levels or maintenance free batteries). This is not a manufacturing fault.

The warranty does not cover batteries that have been incorrectly used or installed. Improper maintenance includes the removal of the battery lid, this is especially relevant to AGM and ...
