

Which type of household battery is more durable

What are the different types of batteries?

Both types are further classified into different batteries depending on the chemicals used in them. For example, a lead-acid battery used in vehicles is a secondary battery, and the zinc-carbon batteries used in flashlights are primary batteries. There are also lithium-ion batteries, which are a type of rechargeable or secondary battery.

Which battery has the highest capacity?

Lithium batteries offer the highest capacity among all primary batteries. The active anode material in these batteries is lithium, thus the name. It covers numerous other advantages such as lightweight, long shelf life, appropriate to use in extreme temperatures, high specific energy, etc. Also known as Lithium-metal battery.

Which rechargeable battery should I use?

Go with NiMH or NiZn instead. Lowest self-discharge of any rechargeable, making it good for devices where batteries are replaced infrequently, like clocks and radios. But the capacity drops every time it's charged, and prone to leaking. Cheap, widely available, but usually can't be recharged, and can leak. Good for low-drain devices.

Are alkaline batteries good?

For low-drain devices like clocks, alkalines are acceptable, since they'll last a long time in clocks, so their lack of recharging ability isn't such a big downside (although personally I still use LSD NiMH for that application). Which brand of battery is best?

What are the advantages and disadvantages of primary batteries?

The key advantages of primary batteries are they are cheap, lightweight, easily available, have less maintenance, and come in several configurations. They are usually used in devices with low current drain. The major disadvantage is that they cannot be reused. Also, these have comparatively less capacity.
